(54) Title: NOVEL SULFONIC ACID DERIVATIVES

(I)

(57) Abstract: A process for making a compound of the
formula (1) or the pharmaceutically acceptable salt thereof;
wherein X, Y, a, b, c, d, R¹, R², R³ and R⁵ are as defined
above useful to treat inflammation and other immune dis-
orders.

NOVEL SULFONIC ACID DERIVATIVES

Background of the Invention

The present invention relates to novel sulfonic acid derivatives, methods of use and pharmaceutical compositions containing them.

5 The compounds of the invention are potent and selective inhibitors of MIP-1 α (CCL3) binding to its receptor CCR1 found on inflammatory and immunomodulatory cells (preferably leukocytes and lymphocytes). The CCR1 receptor is also sometimes referred to as the CC-CKR1 receptor. These compounds also inhibit MIP-1 α (and the related chemokines shown to interact with CCR1 (e.g., RANTES (CCL5), MCP-2 (CCL8), MCP-3 (CCL7), HCC-1 (CCL14) and HCC-2 (CCL15))) induced chemotaxis of THP-1 cells and human leukocytes and are potentially useful for the treatment or prevention of autoimmune diseases (such as rheumatoid arthritis, type I diabetes (recent onset), lupus, inflammatory bowel disease, optic neuritis, psoriasis, multiple sclerosis, polymyalgia rheumatica, uveitis, and vasculitis), acute and chronic inflammatory conditions (such as osteoarthritis, adult Respiratory Distress Syndrome, Respiratory Distress Syndrome of infancy, ischemia reperfusion injury, and glomerulonephritis), allergic conditions (such as asthma and atopic dermatitis), infection associated with inflammation (such as viral inflammation (including influenza and hepatitis) and Guillian-Barre), chronic bronchitis, xeno-transplantation, transplantation tissue rejection (chronic and acute), organ rejection (chronic and acute), atherosclerosis, restenosis (including, but not limited to, restenosis following balloon and/or stent insertion), HIV infectivity (co-receptor usage), and granulomatous diseases (including sarcoidosis, leprosy and tuberculosis) and sequelae associated with certain cancers such as multiple myeloma. Compounds in this series may also have utility for the prevention of cancer metastasis. Compounds in this series may also limit the production of cytokines at inflammatory sites, including but not limited to TNF and IL-1, as a consequence of decreasing cell infiltration, providing benefit for diseases linked to TNF and IL-1, including congestive heart failure, pulmonary emphysema or dyspnea associated therewith, emphysema; HIV-1, HIV-2, HIV-3; cytomegalovirus (CMV), adenoviruses, Herpes viruses (*Herpes zoster* and *Herpes simplex*). They may also provide benefit for the sequelae associated with infection where such infection induces production of detrimental inflammatory cytokines such as TNF e.g, fungal meningitis, joint tissue damage, hyperplasia, pannus formation and bone resorption, psoriatic arthritis, hepatic failure, bacterial meningitis, Kawasaki syndrome, myocardial infarction, acute liver failure, lyme disease, septic shock, cancer, trauma, and malaria, etc.

35 MIP-1 α and RANTES are soluble chemotactic peptides (chemokines) which are produced by inflammatory cells, in particular CD8⁺ lymphocytes, polymorphonuclear leukocytes (PMNs) and macrophages, J.Biol. Chem., 270 (30) 29671-29675 (1995). These chemokines act by inducing the migration and activation of key inflammatory and

immunomodulatory cells. Elevated levels of chemokines have been found in the synovial fluid of rheumatoid arthritis patients, chronic and rejecting tissue from transplant patients and in the nasal secretions of allergic rhinitis patients following allergen exposure (Teran, *et al.*, *J. Immunol.*, 1806-1812 (1996), and Kuna *et al.*, *J. Allergy Clin. Immunol.* 321 (1994)).

- 5 Antibodies which interfere with the chemokine/receptor interaction by neutralizing MIP1 α or gene disruption have provided direct evidence for the role of MIP-1 α and RANTES in disease by limiting the recruitment of monocytes and CD8 $^{+}$ lymphocytes (Smith *et al.*, *J. Immunol.*, 153, 4704 (1994) and Cook *et al.*, *Science*, 269, 1583 (1995)). Together this data demonstrates that CCR1 receptor antagonists would be an effective treatment of several
- 10 immune based diseases. The compounds described within are potent and selective antagonists of the CCR1 receptor.

SCHEME 2

SCHEME 3

In reaction 1 of Preparation A, the compound of formula II, wherein b is 0, 1 or 2, is converted to the corresponding compound of formula III by reacting II with a benzaldehyde compound of the formula

5 in the presence of a base, such as triethylamine, and a reducing agent, such as sodium triacetoxyborohydride, in an aprotic solvent, such as 1,2-dichloroethane. The reaction mixture is stirred at room temperature for a time period between about 1 hour to about 4 hours, preferably about 2 hours.

10 In reaction 2 of Preparation A, the compound of formula III is converted to the corresponding compound of formula IV by first reacting a compound of the formula

15 wherein c is 0, 1 or 2, with 4-methyl morpholine and isobutylchloroformate in the presence of a polar aprotic solvent, such as tetrahydrofuran, followed by reacting the intermediate so formed with the compound of formula III. The reaction mixture, so formed, is stirred overnight at ambient temperature.

20 In reaction 3 of Preparation A, the compound of formula IV is converted to the corresponding piperazine-2,5-dione compound of formula V by treating IV with trifluoroacetic acid in the presence of a polar aprotic solvent, such as methylene chloride. The reaction is stirred, at room temperature, for a time period between about 1 hour to about 4 hours, preferably about 2 hours.

25 In reaction 4 of Preparation A, the compound of formula V is converted to the corresponding compound of formula VI by reducing V with a reducing agent, such as lithium aluminum hydride. The reaction is conducted at a temperature between about -10°C to about 10°C, preferably about 0°C, for a time period between about 10 minutes to about 90 minutes, preferably about 40 minutes.

30 In reaction 5 of Preparation A, the compound of formula VI is converted to the corresponding compound of formula VII by reacting VI with chloroacetyl chloride in the presence of a base, such as triethylamine, in a polar aprotic solvent, such as methylene chloride, at ambient temperature for a time period between 15 minutes and 3 hours, preferably about 30 minutes.

In reaction 6 of Preparation A, the compound of formula VI is converted to the corresponding compound of formula VIII by reacting VI with acetoxy acetylchloride in the

presence of a base, such as triethylamine, in a polar aprotic solvent, such as methylene chloride, at ambient temperature for a time period between 15 minutes and 4 hours, preferably about 1 hour. The resulting acetyl-protected alcohol is reacted with lithium hydroxide hydrate in a solvent mixture including water, tetrahydrofuran and methanol, at
5 ambient temperature for a time period between 1 hour and 8 hours, preferably about 2 hours.

In reaction 1 of Preparation B the compound of formula **IX** is converted to the corresponding compound of the formula **X** by treating **IX** with a reducing agent, such as lithium aluminum hydride, in an aprotic solvent, such as tetrahydrofuran. The reaction mixture is heated to reflux for a time period between 1 hour and 6 hours, preferably about 2 hours.

10 In reaction 2 of Preparation B the compound of formula **X** is converted to the corresponding compound of the formula **XI** by first converting the hydroxyl group to a chloro group by reacting **X** with thionyl chloride, in the presence of an aprotic solvent, such as methylene chloride. The reaction is heated to reflux, for a time period between about 1 hour to about 10 hours, preferably about 3 hours. The resulting alkyl chloride is then treated with a
15 cyanide source, such as potassium cyanide, in the presence of an aprotic solvent, such as acetonitrile and a crown ether, such as 18-crown-6. The reaction mixture is stirred at ambient temperature for a time period between about 1 hour to about 10 hours, preferably about 3 hours.

In reaction 3 of Preparation B the compound of formula **XI** is converted to the
20 compound of formula **XII** by first treating **XI** with a hydroxide source, such as potassium hydroxide in a mixture of ethanol and water. The reaction mixture is heated to reflux for a time period between about 1 hour to about 10 hours, preferably about 8 hours.

In reaction 4 of Preparation B the compound of formula **XII** is converted to the
25 compound of formula **XIII** by treating with ethanol in the presence of an acid, such as hydrochloric acid, at ambient temperature for a time period between about 8 hours to about 16 hours, preferably about 12 hours.

In reaction 5 of Preparation B the compound of formula **XIII** is converted to the corresponding compound of formula **XIV**, by first treating **XIII** with an reducing agent, as above in reaction 1 of Preparation B. The resultant alcohol may be converted to **XIV** with an
30 oxidizing agent, such as Dess-Martin periodinane, in the presence of an aprotic solvent, such as tetrahydrofuran at ambient temperature for a time period between about 1 hour to about 16 hours, preferably about 4 hours.

In reaction 6 of Preparation B the compound of formula **X** is converted to the corresponding compound of formula **XV** by first treating **X** with an oxidizing agent, such as
35 Dess-Martin periodinane, in the presence of an aprotic solvent, such as tetrahydrofuran at ambient temperature for a time period between about 1 hour to about 16 hours, preferably about 4 hours.

In reaction 7 of Preparation B the compound of formula **XV** is converted to the corresponding compound of formula **XVI**, wherein e may equal 2-7, by first treating **XV** with a phosphonium ylide derived from the phosphonium salt of the formula:

- 5 wherein f may be (C₁₋₆)-alkyl, wherein alkyl is defined as above, in the presence of an aprotic solvent, such as tetrahydrofuran. The reaction is conducted at a temperature between -78 °C and reflux, the preferred temperature is dependent on which phosphonium ylide is utilized, for a time period between about 4 hours to about 16 hours, preferably about 10 hours (For similar transformations, see: J. Am. Chem. Soc. 1985, 107, 217). The resulting olefinic ester is then hydrogenated by shaking under a positive pressure of hydrogen in the presence of a catalyst, such as platinum dioxide, in the presence of an aprotic solvent such as ethyl acetate. The ester is then reduced and reoxidized according to the procedure described in reaction 5 of Preparation B to afford compound of formula **XVI**.

- 15 In reaction 8 of Preparation C compounds of formula **XIV**, **XV** or **XVI** are converted to the corresponding compound of formula **XVIII**, wherein g equals 0-7, by demethylating the methyl ether with acid, such as 47% aqueous hydrogen bromide. The reaction mixture is heated to reflux for a time period between about 10 hours to about 30 hours, preferably about 24 hours.

- 20 In reaction 1 of Scheme 1, the compound of formula **VII** is converted to the corresponding compound of formula **XVIII**, wherein g equals 0-7, by reacting **VII** with a compound of the formula **XVII** in the presence of potassium carbonate, potassium iodide and an aprotic solvent, such as dimethylformamide. The reaction is heated to reflux for a time period between about 4 hours to about 8 hours, preferably about 6 hours.

- 25 In reaction 2 of Scheme 1, the compound of formula **XVIII** is converted to the corresponding compound of formula **XIX**, wherein g equals 0-7, by reacting **XVIII** with a reducing agent, such as sodium borohydride, in an aprotic solvent, such as tetrahydrofuran, at a temperature between about -10°C and ambient temperature, preferably ambient for a time period between 15 minutes and 90 minutes, preferably about 60 minutes.

- 30 In reaction 3 of Scheme 1, the compound of formula **XIX** is converted to the corresponding compound of formula **XX**, wherein g equals 0-7, as described in reaction 2 of preparation B.

- 35 In reaction 4 of Scheme 1, the compound of formula **XX** is converted to the corresponding compound of formula **I** by reacting **XX** with sodium sulfite in water, at a temperature between 70°C and 100°C, preferably 100°C for a time period between 1 and 5 hours, preferably about 1 hour. The addition of catalytic sodium iodide may be advantageous.

In reaction 1 of Scheme 2, the compound of formula VIII is converted to the corresponding compound of formula XXI by reacting VIII with a compound of formula

where Y is a (C2-C9) heteroaryl wherein the chlorine is attached to a carbon atom that is adjacent to a heteroatom (for example, 2-pyridyl) and wherein h equals 0-7. The reactants are stirred in a polar aprotic solvent, such as acetonitrile, in the presence of a base, such as triethylamine, at reflux temperature for a time period between about 4 hours and 24 hours, preferably about 12 hours.

In reaction 2 of Scheme 2, the compound of formula XXI, where Y is a (C2-C9) heteroaryl, may be converted into I using the methodologies described above in Scheme 1.

In reaction 1 of Scheme 3, the compound of formula VII may be converted to the corresponding compound of formula XXII, where Y is a (C2-C9) heteroaryl, by reacting VII with tert-butoxycarbonylamino-acetic acid in an aprotic solvent, such as methylene chloride, with a carbodiimide, such as dicyclohexylcarbodiimide, in the presence of a base, such as triethylamine, at room temperature for a time period between about 1 and 24 hours, preferably about 3 hours. The compound of formula XXII may subsequently be produced from this carbamate by the action of trifluoroacetic acid at room temperature for a time period between about 1 and 12 hours, preferably about 4 hours.

In reaction 2 of Scheme 3, the compound of formula XXII may be converted to the corresponding compound of formula XXIII, where Y is a (C2-C9) heteroaryl, following the precedent set forth in reaction 1 of Scheme 2.

In reaction 3 of Scheme 3, the compound of formula XXIII may be converted to the corresponding compound of formula XXIV, where Y is a (C2-C9) heteroaryl, by first reducing the ester to the corresponding alcohol with a reducing agent, such as sodium borohydride, in tert-butanol and methanol, at a temperature between about 20°C and reflux, preferably reflux for a time period between 1 hour and 6 hours, preferably about 1 hour. The resultant alcohol may be converted to the compound of formula XXIV by treating with an oxidizing agent, such as Dess-Martin periodinane, in the presence of an aprotic solvent, such as tetrahydrofuran at ambient temperature for a time period between about 1 hour to about 16 hours, preferably about 4 hours.

In reaction 4 of Scheme 3, the compound of formula XXIV, where Y is a (C2-C9) heteroaryl, may be converted into I using the methodologies described above in Scheme 1.

Unless indicated otherwise, the pressure of each of the above reactions is not critical. Generally, the reactions will be conducted at a pressure of about one to about three atmospheres, preferably at ambient pressure (about one atmosphere).

The compounds of the formula I which are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids. Although such salts

must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to initially isolate a compound of the formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent, and subsequently convert the free base to a
5 pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent such as methanol or ethanol. Upon careful evaporation of the solvent, a solid salt is obtained.

10 The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate or bisulfate, phosphate or acid phosphate, acetate, lactate, citrate or acid citrate, tartrate or bitartrate, succinate, maleate, fumarate, gluconate,
15 saccharate, benzoate, methanesulfonate and pamoate (i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)) salts.

Those compounds of the formula I which are also acidic in nature, are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline-earth metal salts and particularly, the sodium and
20 potassium salts. These salts are all prepared by conventional techniques. The chemical bases which are used as reagents to prepare the pharmaceutically acceptable base salts of this invention are those which form non-toxic base salts with the herein described acidic compounds of formula I. These non-toxic base salts include those derived from such pharmacologically acceptable cations as sodium, potassium, calcium and magnesium, etc.
25 These salts can easily be prepared by treating the corresponding acidic compounds with an aqueous solution containing the desired pharmacologically acceptable cations, and then evaporating the resulting solution to dryness, preferably under reduced pressure. Alternatively, they may also be prepared by mixing lower alkanolic solutions of the acidic compounds and the desired alkali metal alkoxide together, and then evaporating the resulting
30 solution to dryness in the same manner as before. In either case, stoichiometric quantities of reagents are preferably employed in order to ensure completeness of reaction and maximum product yields.

Compounds of the formula I and their pharmaceutically acceptable salts (hereinafter also referred to, collectively, as "the active compounds") are potent antagonists of the CCR1
35 receptor. The active compounds are useful in the treatment or prevention of autoimmune diseases (such as rheumatoid arthritis, type I diabetes (recent onset), lupus, inflammatory bowel disease, optic neuritis, psoriasis, multiple sclerosis, polymyalgia rheumatica, uveitis,

and vasculitis), acute and chronic inflammatory conditions (such as osteoarthritis, adult Respiratory Distress Syndrome, Respiratory Distress Syndrome of infancy, ischemia reperfusion injury, glomerulonephritis, and chronic obstructive pulmonary disease (COPD)), allergic conditions (such as asthma and atopic dermatitis), inflammation associated with
5 infection (such as viral inflammation (including influenza, hepatitis and Guillian-Barre), chronic bronchitis, chronic and acute tissue, cell, and solid organ transplant rejection (including xeno-transplantation), atherosclerosis, restenosis, HIV infectivity (co-receptor usage), and granulomatous diseases (including sarcoidosis, leprosy and tuberculosis) and sequelae associated with certain cancers such as multiple myeloma. Compounds in this series may
10 also have utility for the prevention of cancer metastasis, as well as restenosis following balloon and/or stent insertion. Compounds in this series may also limit the production of cytokines at inflammatory sites, including but not limited to TNF and IL-1, as a consequence of decreasing cell infiltration, providing benefit for diseases linked to TNF and IL-1 including congestive heart failure, pulmonary emphysema or dyspnea associated therewith,
15 emphysema; HIV-1, HIV-2, HIV-3; cytomegalovirus (CMV), adenoviruses, Herpes viruses (*Herpes zoster* and *Herpes simplex*). They may also provide benefit for the sequelae associated with infection where such infection induces production of detrimental inflammatory cytokines such as TNF e.g. fungal meningitis, joint tissue damage, hyperplasia, pannus formation and bone resorption, psoriatic arthritis, hepatic failure, bacterial meningitis,
20 Kawasaki syndrome, myocardial infarction, acute liver failure, Lyme disease, septic shock, cancer, trauma, and malaria, etc.

The activity of the compounds of the invention can be assessed according to procedures known to those of ordinary skill in the art. Examples of recognized methods for determining CCR1 induced migration can be found in Coligan, J. E., Kruisbeek, A.M.,
25 Margulies, D.H., Shevach, E.M., Strober, W. editors: Current Protocols In Immunology, 6.12.1- 6.12.3. (John Wiley and Sons, NY, 1991). One specific example of how to determine the activity of a compound for inhibiting migration is described in detail below.

Chemotaxis Assay:

The ability of compounds to inhibit the chemotaxis to various chemokines can be
30 evaluated using standard 48 or 96 well Boyden Chambers with a 5 micron polycarbonate filter. All reagents and cells can be prepared in standard RPMI (BioWhittaker Inc.) tissue culture medium supplemented with 1 mg/mL of bovine serum albumin. Briefly, MIP-1 α (Peprotech, Inc., P.O. Box 275, Rocky Hill NJ) or other test agonists, are placed into the lower chambers of the Boyden chamber. A polycarbonate filter is then applied and the upper
35 chamber fastened. The amount of agonist chosen is that determined to give the maximal amount of chemotaxis in this system (e.g., 1 nM for MIP-1 α should be adequate).

THP-1 cells (ATCC TIB-202), primary human monocytes, or primary lymphocytes, isolated by standard techniques can then be added to the upper chambers in triplicate together with various concentrations of the test compound. Compound dilutions can be prepared using standard serological techniques and are mixed with cells prior to adding to the chamber.

After a suitable incubation period at 37 degrees centigrade (e.g. 3.5 hours for THP-1 cells, 90 minutes for primary monocytes), the chamber is removed, the cells in the upper chamber aspirated, the upper part of the filter wiped and the number of cells migrating can be determined according to the following method.

For THP-1 cells, the chamber (a 96 well variety manufactured by Neuroprobe) can be centrifuged to push cells off the lower chamber and the number of cells can be quantitated against a standard curve by a color change of the dye fluorocein diacetate.

For primary human monocytes, or lymphocytes, the filter can be stained with Dif Quik® dye (American Scientific Products) and the number of cells migrating can be determined microscopically.

The number of cells migrating in the presence of the compound are divided by the number of cells migrating in control wells (without the compound). The quotient is the % inhibition for the compound which can then be plotted using standard graphics techniques against the concentration of compound used. The 50% inhibition point is then determined using a line fit analysis for all concentrations tested. The line fit for all data points must have an coefficient of correlation (R squared) of > 90% to be considered a valid assay.

All of the compounds of the invention illustrated in the following examples had IC_{50} of less than $10\mu M$, in the Chemotaxis assay.

The compositions of the present invention may be formulated in a conventional manner using one or more pharmaceutically acceptable carriers. Thus, the active compounds of the invention may be formulated for oral, buccal, intranasal, parenteral (e.g., intravenous, intramuscular or subcutaneous) or rectal administration or in a form suitable for administration by inhalation or insufflation. The active compounds of the invention may also be formulated for sustained delivery.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g., pregelatinized maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g., lactose, microcrystalline cellulose or calcium phosphate); lubricants (e.g., magnesium stearate, talc or silica); disintegrants (e.g., potato starch or sodium starch glycolate); or wetting agents (e.g., sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or

suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g., sorbitol syrup, methyl cellulose or hydrogenated edible fats); emulsifying agents (e.g., lecithin or acacia); non-aqueous vehicles (e.g., almond oil, oily esters or ethyl alcohol); and
5 preservatives (e.g., methyl or propyl p-hydroxybenzoates or sorbic acid).

For buccal administration, the composition may take the form of tablets or lozenges formulated in conventional manner.

The active compounds of the invention may be formulated for parenteral
10 administration by injection, including using conventional catheterization techniques or infusion. Formulations for injection may be presented in unit dosage form, e.g., in ampules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents. Alternatively,
15 the active ingredient may be in powder form for reconstitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.

The active compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

20 For intranasal administration or administration by inhalation, the active compounds of the invention are conveniently delivered in the form of a solution or suspension from a pump spray container that is squeezed or pumped by the patient or as an aerosol spray presentation from a pressurized container or a nebulizer, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon
25 dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurized container or nebulizer may contain a solution or suspension of the active compound. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated containing a powder mix of a compound of the invention and a suitable powder
30 base such as lactose or starch.

A proposed dose of the active compounds of the invention for oral, parenteral or buccal administration to the average adult human for the treatment of the conditions referred to above (e.g., rheumatoid arthritis) is 0.1 to 1000 mg of the active ingredient per unit dose which could be administered, for example, 1 to 4 times per day.

35 Aerosol formulations for treatment of the conditions referred to above (e.g., rheumatoid arthritis) in the average adult human are preferably arranged so that each metered dose or "puff" of aerosol contains 20 µg to 1000 µg of the compound of the invention.

The overall daily dose with an aerosol will be within the range 0.1 mg to 1000 mg. Administration may be several times daily, for example 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

The active agents can be formulated for sustained delivery according to methods well known to those of ordinary skill in the art. Examples of such formulations can be found in United States Patents 3,538,214, 4,060,598, 4,173,626, 3,119,742, and 3,492,397.

The compounds of the invention can also be utilized in combination therapy with immunosuppressant agents including but not limited to rapamycin, cyclosporin A, FK-506, Cellcept®, azathioprine, and IL-2R inhibitory antibodies or with classical anti-inflammatory agents (e.g. cyclooxygenase/lipoxygenase inhibitors) such as but not limited to, aspirin, acetaminophen, naproxen and piroxicam or with cytokine inhibitory agents including but not limited to ENBREL.

The following Examples illustrate the preparation of the compounds of the present invention. Commercial reagents were utilized without further purification. Chromatography refers to column chromatography performed using 32-63 mm silica gel and executed under nitrogen pressure (flash chromatography) conditions. Particle Beam Mass Spectra were recorded on either a Hewlett Packard 5989®, utilizing chemical ionization (ammonium), or a Fisons (or MicroMass) Atmospheric Pressure Chemical Ionization (APCI) platform which uses a 50/50 mixture of acetonitrile/water. Room or ambient temperature refers to 20-25 °C. All non-aqueous reactions were run under a nitrogen atmosphere for convenience and to maximize yields. Concentration in vacuo means that a rotary evaporator was used. The names for the compounds of the invention were created by the Autonom 2.0 PC-batch version from Beilstein Informationssysteme GmbH (ISBN 3-89536-976-4)
